

Fall protection - AS16

Fall protection is the ideal product for securing the fall zone at excavation pits or shafts. We supply a post pallet equipped with 16 sturdy steel posts, which are removed using an excavator and pressed into the ground. Wooden planks are inserted into the sides of the steel posts to serve as railings.

Thanks to its practical design, the post pallet can be moved using a forklift, wheel loader, or excavator. With variable post spacing of up to three meters, the fall protection system is a flexible solution for greater safety in civil engineering. One pallet is sufficient to secure three shoring areas, including head shoring.
